

MeguriPass

Theme park digital stamp rally turning visits into collectible Solana NFTs

The Problem & Our Solution

Paper stamp rallies are loved in Japan but leave no lasting value, no community, and no data for venues.

- Paper stamps are thrown away after the visit, losing all memory value
- Venues get zero engagement data or way to re-connect with visitors
- Fans have no way to show off or trade their collection
- MeguriPass turns each stamp into a compressed NFT on Solana via QR check-in
- Completing a set unlocks a token-gated community and real rewards

How It Works

Visitors scan QR codes at attractions, a backend verifies the check-in, and a compressed NFT stamp is minted instantly to their wallet.

- User flow: connect Phantom wallet, scan QR at attraction, receive NFT stamp, track progress
- Architecture: Next.js frontend, Supabase backend for QR/session logic, Anchor program on Solana
- On-chain: Metaplex Bubblegum mints compressed NFTs per stamp, keeping costs near-zero at scale
- Completing all stamps unlocks token-gated Discord or LINE community access
- Venue dashboard lets staff create campaigns and view collection stats

Built with

Solana, Anchor, Metaplex Bubblegum (compressed NFTs), Next.js, Phantom Wallet Adapter, Supabase, QR code scanning (Web)

Why Now & What's Next

Compressed NFTs finally make mass stamp issuance affordable, and Japanese leisure venues are actively seeking digital engagement tools.

- Bubblegum compression makes minting thousands of stamps per day economically viable
- Japanese parks and events already run stamp rallies, an easy transition point
- Next: pilot with one real amusement park or local event
- Then: add a merchandise redemption marketplace for completed sets
- Longer term: a shared multi-venue loyalty network standard
